Website Design   Task 3 – Technical Document   Matthew Theuma

I first created a header container, to navigate through the website (home page, about page, destinations page, tips, photographs and the contact form). I used the .href to link one html to the other and style them neatly with CSS. The position for the header container is fixed, so that it stays static when you scroll. It also features a hovering attribute, so that when you hover on the titles of the header, they get dark and bold.

Then I added content in the body, such as:

- **Header: <h2>** (font-weight: 700;)
- **Text: <p>** (padding around 50px to 100px + font-family: arial, helvetica; + text-align justify;)
- **Images** (figcaption
- **List of Content (with the use of grids)**
- **Image Grids (E.g. col-7)**

Finally at the end, I added a footer with a .mailto attribute. The footer is built with a gray container at the bottom of the page.

My original plan for the **'Destinations.html'** page was that the 'Overlay-Images' would be in three columns and multiple rows. But I have noticed that for the only three destinations I wrote, I had to reduce from the plan. So I just fitted three 'Overlay-Images' in one column, bigger and more visual.

Further on, the pages of the countries include padding-left and right (so that the whole content is centred with space on the edges).

For the **'Photographs.html'** page, I created an Image grid with two classes called "imgs-row" and "imgs-column", with padding on the left and right, and are all vertically aligned in the middle. I have used attribute 'display: flex;'.

For the **'Contacts.html'** page, I used the <form> element to process the input.
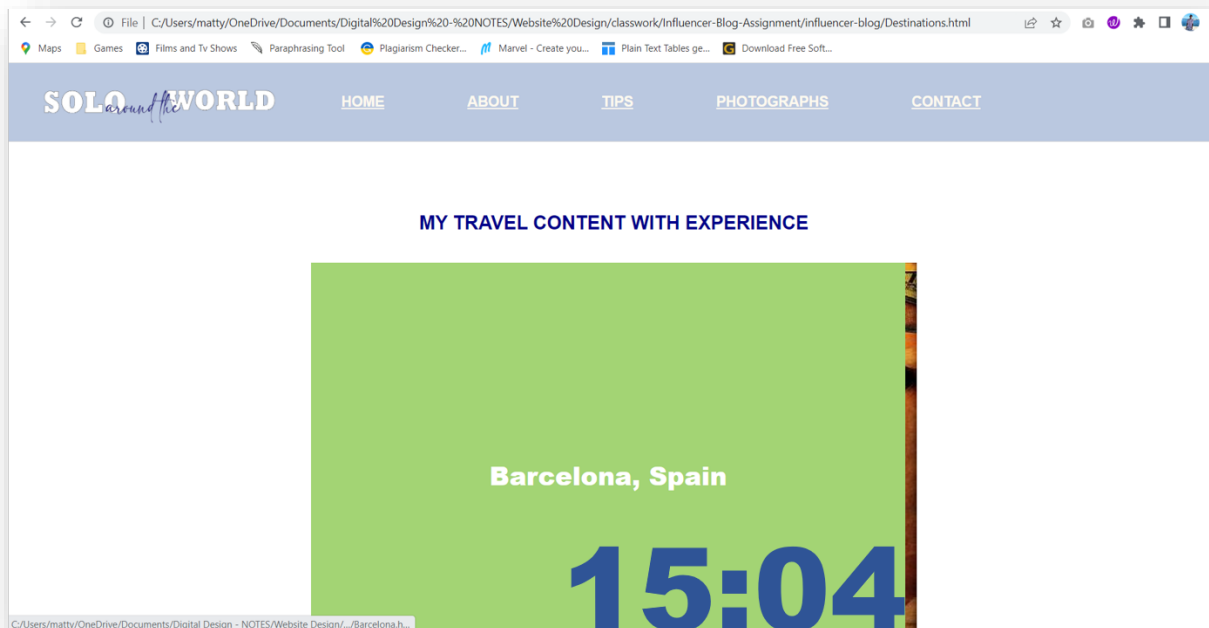

The form involves:

- First Name
- Last Name
- Country List
- Message

**Looking back at what I have done, I would add more Internet Services like:**

- Time Services (which provide time information of different localities).
- Newsgroup Services (which users share discussions in different locations using the same internet).

I believe that these two services would help my website be more dynamic and active. Time Services would come in use for the audience to know what time it is in different locations, and the time difference (as a must-know before going abroad somewhere). In addition, Newsgroup Services can serve as a notebook feed for people going abroad, sharing advice, stories and communication.

Time Services – Destinations Page
(gives out the current local time, as you hover on the image)

NewsGroup Services – Communicate Page
(communication service with local active travellers)
